

KOSOVO POPULATION PROJECTION 2011-2061

Pristina
December 2013

Financed by the Trust Fund of the Population Census 2011

This report is prepared by the staff of Kosovo Agency of Statistics in cooperation with the demographics expert hired by UNFPA (Kosovo)

The team that prepared this report includes:

Sabri Zabërgja, Director of Population Census Office, KAS
Kadri Sojeva, Deputy Manager of Population Census Office, KAS
Avni Kastrati, Deputy Manager of Population Census Office, KAS
Zymer Maxharri, Analyst, Population Census Office, KAS
Dren Gashi, Information Technology Sector, Population Census Office, KAS
Sanije Uka, Department of Population Statistics, KAS
Arijeta Sojeva, Department of Population Statistics, KAS
Nico Keilman, Demographics Expert, University of Oslo, Norway

Acknowledgements

This report is prepared by the staff of Kosovo Agency of Statistics (KAS) with the support of UNFPA Office in Kosovo.

During the preparation of this Report, the KAS staff involved in this project has acquired new knowledge on projections, by using advanced applied methods for projections.

Valuable contribution to the preparation of this report was given by Mr. Nico Keilman, Demographics Professor with the Department of Economics, University of Oslo, Norway, who was hired with the support of the UNFPA Office in Pristina.

We would also like to thank Mrs. Visare Mujku-Nimani of UNFPA for her support in preparing this report.

We would also like to thank the professional staff of Kosovo Agency of Statistics and other local institutions for their comments and assessments given during the finalization of this report.

Introduction

Population Projections 2011-2061

This is the first time the Kosovo Agency of Statistics is making population projections based on the international criteria and standards for population projections.

The report presents the Kosovo population projections for a 50-year period, starting from 2011-2061, by age and gender.

This report is important as it represents an orientation for the population trends up to 2061. Without such a report, it would be difficult to be oriented in terms of strategic planning on economic, social, educational and health needs.

For demographers, statisticians, the cohort analysis and its components for the upcoming years, with the stated hypothesis for the developments of fertility, mortality and migration, will be important for the analysis of demographic trends in the country, as well as for specified areas in the future.

These data will also help in the preparation of plans, strategies, analysis and researches in the areas such as housing, education, various services, transportation etc.

Therefore, the projection of demographic developments for a 50-year period, including age and gender, will be important for both the local and national levels.

This population projection is also important for institutions and organizations, businesses and stakeholders, research and academic institutions, analysts, individuals and other authorities in the preparation of their plans, especially the macroeconomic ones.

This report was made possible due to the fact that in 2011 Kosovo conducted the population census based on international criteria and standards for censuses, where the detailed demographic data on various indicators were the grounds for compiling this report.

Therefore, I hope that this report will serve as a guide for the users of demographic data during their work.

Chief Executive Officer of Kosovo Agency of Statistics

Isa Krasniqi

Foreword

The report on Kosovo Population Projection is the first such report prepared by the institutions of Kosovo, Kosovo Agency of Statistics.

The preparation of this report was enabled based on the data derived from the population census conducted in April 2011, population estimations 2011 and 2012 etc.

The report “Kosovo Population Projection” for the period 2011-2061 presents the population trends by age over years, including the gender.

The report is divided into six chapters and each chapter includes a 10-year period, with brief analysis on demographic developments during that period.

Due to the influence of various factors on demographic processes of a certain period, Kosovo Agency of Statistics (KAS) will update population projections (this report) within the next 3-5 years.

The report presents three options of demographic trends for the stated period:

- 1. High Variant,**
- 2. Medium Variant, and**
- 3. Low Variant**

Data users are recommended to use the medium variant in various planning and analysis.

About the population census

The population census is the main statistical activity as well as the most important source of information regarding the size and the socio-economic conditions of a country, which provides comprehensive information about the population in a certain period.

The population census is one of the most important and a complex activity of a country and it is considered the greatest operation of a country in peacetime.

The data derived from the population census provide a detailed overview of population, and it is unique because it covers everybody at the same time, the questions are unique, which makes the comparison of different parts of a country easier.

The data derived from the population census makes other researches possible as well as their analysis, becoming the basic/determinative factor of the quality of various researches.

The census is also used as a milestone for many other statistics series such as population estimations/projections and other socio-economic conditions as well.

Furthermore, the Census represents a very important element of the statistical infrastructure itself, as its results make it possible to derive proportional samples for each survey that takes into account the households as basic units.

The census also enables capacity building and it is an important experience for the statistics institution itself.

Population projection for Kosovo

Historical tendencies and assumptions for the components of change

1. The method of cohort component and the data requirements

Population projections are essential tools for setting policies and planning in a number of areas, including education, social security, health, housing and the labor market. After the Assembly of Kosovo declared the independence in 2008, Kosovo Agency of Statistics (KAS) conducted the first Population and Housing Census on 1 April 2011. The data from this Census, along with other information, will be used in the calculation of the first population projection of the country.

The component method of the group with common features (CMGCF) for the population projections is a standard methodology applied by the agencies of statistics (National Research Council 2000 - United Nations Statistics Division).

The method starts with the latest known table, in which the population is divided by age and gender. This so-called initial population is updated in the next point in time based on the assumptions for:

- *Age and gender specific mortality rates, alternatively, a table of assumed longevity by gender*
- *Fertility rates by mother age*
- *Net migration rates, divided by age and gender.*

Assumptions for all the indicators of these three components relate to the interval that is provided for the first time. After this, over time the structure (CMGCF) functions in a repetitive manner, updating the population in subsequent consecutive intervals, based on the assumptions for mortality, natality and migration rates for each interval.

There is a large number of software available for the calculation of population projections based on the component method of the group with common features:

- **Spectrum,**
- **People,**
- **Mortpak, are only a few of them**

Kosovo Agency of Statistics (KAS) has used the Excel based software developed by Donald Rowland. There is a user guide for the use of this software entitled “Demographic Methods and Concepts” (Oxford University Press 2003). COHORT-COMPONENT PROJECTIONS was the application that KAS has used for the projection.

Since the projection software has to formulate the assumptions for future mortality, natality and migration rates, the historical data for the three types of rates or figures mentioned above are of crucial importance. In addition, the data on the initial population must be of good quality.

During the summer of 2013, the quality of the Census 2011 data related to age and gender, and the quality and availability of the data for the three components, were assessed.

Section 2 summarizes the key findings, section 3 describes the way the initial population was structured, section 4 elaborates the assumptions on the future mortality, natality and international migration rates, and section 5 - Combination of variants.

The projection was made starting from 2011 (including the data of 2011 and 2012) and it extends until 2061.

For all three components, a group of High, Medium and Low assumptions will be formulated. Based on the structure, the differences between the results of High and Low projection variants will increase over time, reflecting the fact that it is more difficult to give an accurate projection for the next 50 years than it is for only the next 10 years.

The Medium variant will reflect the future demographic trends that the KAS estimates as likely possible, based on the current data that were provided and the information on the situation and the demographic trends in the country.

The High and Low variants provide the potential future demographics which are less likely than the Medium variant.

2. Data available, assessment of the missing data and their correction

2.1 Population divided by age and the five-year age group

The projected population is defined as the permanent residential population in Kosovo. For the immigrants this means an intended or actual stay of at least 12 months.

Similarly, individuals who have abandoned Kosovo with the intention of staying abroad for at least 12 months are no longer included in the population of Kosovo.

This definition of the permanent residence is in conformity with the Eurostat recommended definition and in accordance with the methodology used in the 2011 Census.

The Census Results in general are of a good quality .

Approximately 4.3%, due to non-response or because they were absent, were not selected in the age-related group .

An issue of the 2011 Census was that due to various reasons it was not possible to include the population of the three municipalities in the northern part of the country (Leposaviq, Zveçan, Zubin Potok and the northern part of Mitrovica).

The population of these municipalities was estimated to be 40,196 individuals, or 2.3% of Kosovo population . In Section 3, we present the population estimation on the Census date, which includes an estimate of 40,196 individuals, absent by age/gender.

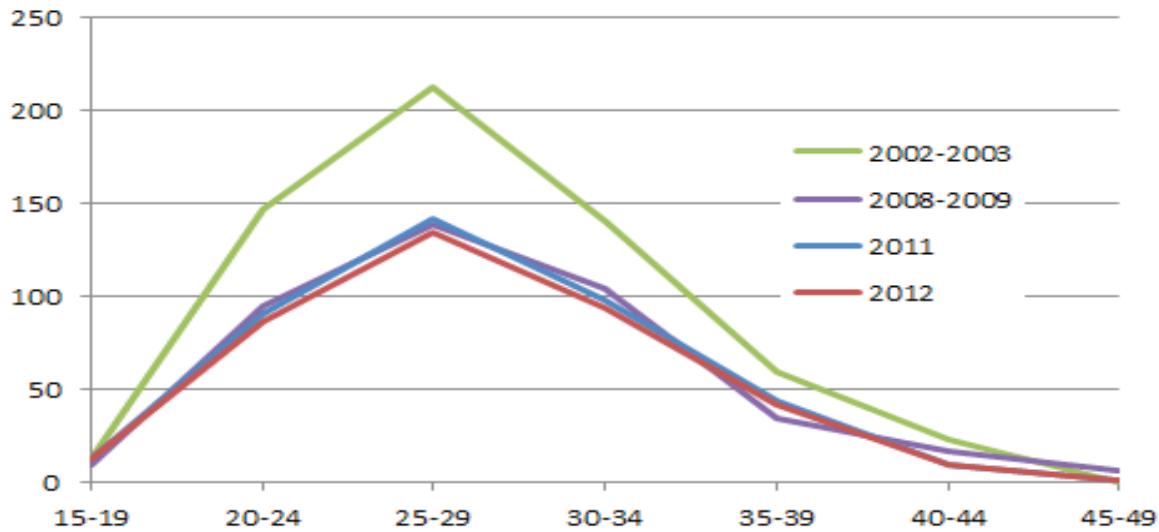

2.2 Natality

Natality rates divided by mother's age (15-19, 20-24...45-49 years old) have been available for some years now from different sources:

According to the vital statistics (2011) combined with the data of population census and the estimated data (2012), and data from the demographic and health surveys (DHS) of years 2002-2003 and 2008-2009; for more info, see the figure for the last two groups of natality rates.

Figure 1 represents the diagrams of these natality rates. Age structure has not changed much after year 2008. For the four curves, the average age for childbearing is between 28.2 and 29.2 years old.

Figura 1. Age-specific natality rates, per thousand women

Note: The rates for 2012 are preliminary.

There is more information on Total Natality Rate (TNR).

The 2009 DHS report provides TNR annual estimations for the years 2002-2009 .

The database of the World Bank contains the TNR estimations for the years 1981-2010.

We have information regarding TNR of 2011 and 2012 from the vital statistics of KAS. The information for the years 1983-1987 was taken from Table 3.11 of the 1989 Statistical Yearbook publication, Statistical Office of Kosovo.

Figure 2 below shows the TNR series diagram.

To a large extent, the data show a tendency of decline in the TNR. From 2005 and onwards, the DHS results are slightly lower than the numbers of the World Bank. The time series of DHS are experiencing some under-enumerations .

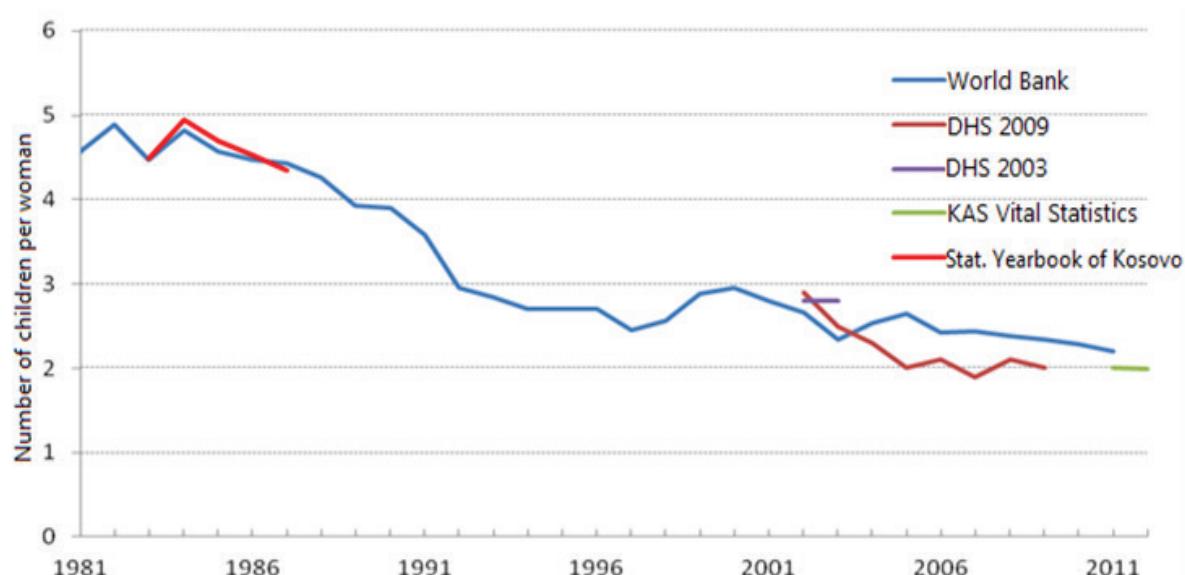

At the same time, the figure for 2011 (an average of 2.0 children per woman; see the green point) appears to be rather high; because the live births and the women aged 15-49 in the northern municipalities were not included in the TNR for that year.

It is generally believed that these women have lower birth rates than the rest of the population. Thus, a TNR that would include the latter group of women would be slightly lower than the reported average of 2.0. However, the number of included women is low.

Therefore, the conclusion is that the real TNR is likely to be closer to the DHS figures than to the World Bank figures for 2005-2009 .

This was confirmed by the vital statistics data for 2011 and 2012 (1,98-2,00 children per woman on average).

Figura 2. Total Natality Rates

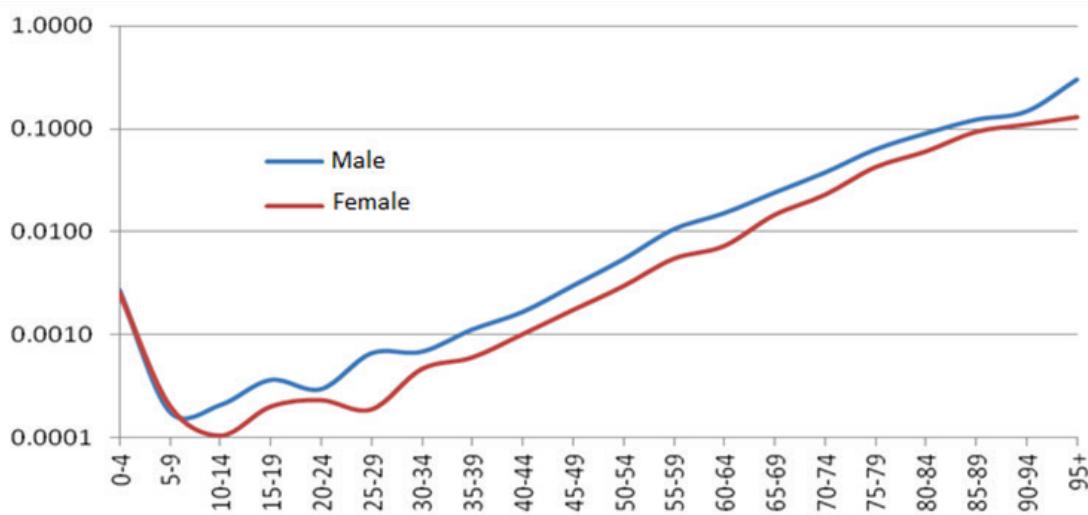

Source: See the text within the figure

2.3 Mortality

Mortality rate time series divided by age and gender are not available from the KAS vital statistics for a certain historical period. KAS has compiled a table for life expectancy calculation in 2011, and this was done based on the number of deaths divided by age (age 0, 1-4, 5-9, 10-14,...90-94, 95+) and gender (from vital statistics), and the number of people probable to die with a corresponding division by age-gender (from the Census). Death rates are illustrated in the diagram shown in Figure 3.

Figure 3. Age-specific mortality rate, 2011

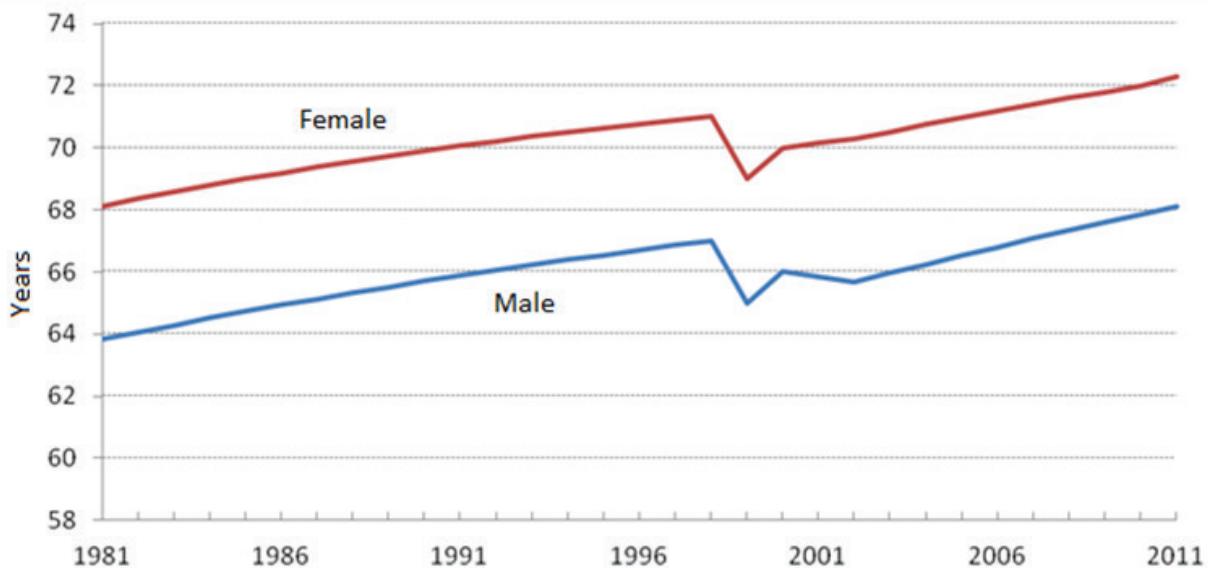

Burimi: Statistikat vitale nga KAS.

The table of life expectancy calculated with these mortality rates as input data (0-4 group age divided into the ones aged 0 and 1-4 group age) results in life expectancy of 75.4 years for men and 80.5 years for women.¹

¹ Here it has been assumed that the exposure time per person among persons aged 95+ in the life expectancy table (L95+) is one half of the time interval, e.g. 2.5 years. As an alternative, we can assume that the exposure time for the ones ages 95+ is equal with the number of the living people aged 95(L95) divided by empirical mortality rate for age 95+. This results in life expectancy figures of 75.4 and 81.3 for men and women respectively.

Figure 4, shows the life expectancy rates for men and women according to the World Bank database.

Figure 4. Life expectancy at birth

Source: Database of the World Bank.

The data show that between 1981 and 1998 life expectancy had increased for around three years. This increases the average for approximately 0.17 years per calendar year.

In 1999 (the war in Kosovo) the life expectancy trend was declining. Starting from 2002 life expectancy has been increasing. At the first glance, these trends are realistic.

However, the life expectancy figures for 2011, based on the table for life expectancy calculation mentioned above, are much higher than the ones suggested by the time trends in the World Bank's figures: more than seven years higher for men (75.4 versus 68.1 years) and more than eight years higher for women (80.5 versus 72.3 years). The reason is that the World Bank had considered that there is an under-registration of deaths in Kosovo.

The Crude Death Rate (CDR), although not required for analyzing the death trends within the CDR projection for the population, can shed more light on this issue.

The information on CDR was collected from different sources: KAS Vital Statistics, the international database of the US Census Bureau, the database of the World Bank, Population Reference Bureau (PRB), and from Eurostat. Table 2 summarizes the findings.

Table 2. Crude Death Rate expressed in promil.

Data source	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012
KAS Vital Statistics	2.8	3.2	3.1	3.5	3.6	3.1	3.2	3.2	3.3	3.4	
USA Censuses	7.1	7	7	7	7	7	7	7	7.1	7	7
World Bank	7.08	6.98	6.95	7.02	7.01	6.99	7.02	7.03	7.05	7	
Population Reference Bureau (USA)								7	7	7	7
Eurostat	3.2	3.5	3.5	3.1	3.2	3.2	N/A	4.0	4.0		3

CDR figures from KAS vital statistics and Eurostat are approximately one-half of the ones from World Bank, USA Census Bureau and PRB (except in year 2012 for the latter one)

Further analysis show that Eurostat used almost the same annual death numbers as KAS, but the size of the population (CDR denominator) was around 1.7 million in the case of Eurostat, while KAS used the figures between 2.0 and 2.2 million inhabitants.

The difference is explained by various definitions. As the basis for its CDR, KAS used the definition of permanent residential population that was used before the 2011 Census, respectively the resident population, plus the one that emigrated.

On the other hand, Eurostat used the definition recommended by Eurostat / United Nations, based on the intended or factual stay of at least 12 months. The persons who are away from country (with the purpose of staying abroad) for at least 12 months were not included.

The USA Federal Census Bureau provides the figure between 12,000-13,000 as the number of deaths for the period, which is nearly twice larger than the figures of KAS and Eurostat. The USA Federal Census Bureau has based its mortality estimations on two sources: Life expectancy, which was 67 years for men and 71 for women in 2007 (as reported by KAS 2007), and 2003 CDR of 7 promil based on the estimations of Preliminary Demographics and Health Survey 2003 (KAS 2004 p.26).

The 2003 survey data indicate a CDR of 5.3 promil, but the DHS report shows an underestimation of the infant mortality.

The report indicates a figure of at least 6 promil, and perhaps closer to 7 promil. It is worth noting the fact that the DH survey in 2009 finds the CDR equal to 5.6 deaths per 1000 persons for the 12 month period before the survey (November 2008 - October 2009) and also admits the under-reporting of deaths².

² KAS 2011, page. 54

Finally, the KAS Bulletin “Kosovo Vital Statistics 2002-2003” indicates that the vital statistics have covered only around 65 percent of the actual number of deaths in those years.

The conclusion is that there is strong evidence for the under-reporting of mortality. The CDR rate of 4 promil for 2011 (using the twelve month criteria for the permanent residential population) is probably too low. The real rates are probably closer to 5 promil.

The figure of 7 promil, as reported by the US Census Bureau, World Bank (2011), and the Population Reference Bureau (2011), is perhaps too high.

Table 3 below shows the results of life expectancy for men and women based on two assumed levels of under-enumeration, 10 and 20 percent respectively. The values that neglect the possible under-enumeration are given as references. Under-enumeration is assumed independent from age and gender.

Table 3, Life expectancy at birth for 2011

Without under-enumeration		10 % under-enumeration		20 % under-enumeration	
Burra	Gra	Burra	Gra	Burra	Gra
75.4	80.5	74.1	79.4	72.7	78.1

As a working hypothesis, we assume that life expectancy at birth in 2011 was 74.1 years for men and 79.4 years for women.

These values correspond to the under-enumeration of 10 percent of the number of deaths in 2011.

2.4 Emigration

Emigration means the departure of a person from Kosovo to another country with the purpose of staying out of the country for at least twelve months. Information of this type has been made available from the Census. During the population census 2011, the respondents have given information about the former household members who have been Kosovo residents in the past, but have gone abroad.

Figure 5 illustrates the absolute numbers of emigration for each year during the period 1980-2010³.

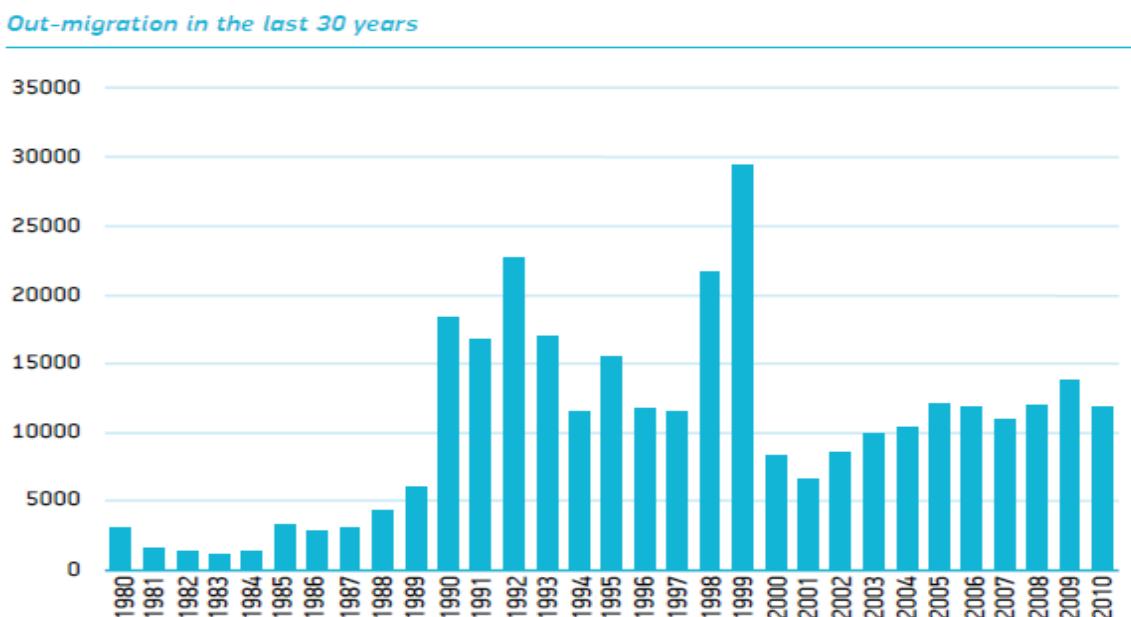

Thus, the total number of emigrations evidenced in the Population Census 2011 was 380,826 inhabitants (only the population born in Kosovo is included in this number and not their descendants who were born in the countries where they now live). There is strong evidence to believe that this number underestimates the true figure for three reasons.

Firstly, not all the emigrants who live abroad could have been reported, (the ones who have no relatives or any member of their former household living currently in Kosovo).

The second factor, less important than the first one, is that events that happened in the distant past (years ago) are likely to have been forgotten/not included. This memory effect is more significant in the first years of emigration period than years later. Finally, the emigration from the four municipalities in the north is not included.

Based on this situation, emigration could have been considerable, but the level is not known. Taking into account these three factors, based on the information the estimation is that the real number is likely between 450,000 and 550,000 emigrants; hence, higher than the Census number of 380,826 persons. However, the emigration numbers for the recent years (between 12,000 and 13,000) are in line with those of the local and international sources.

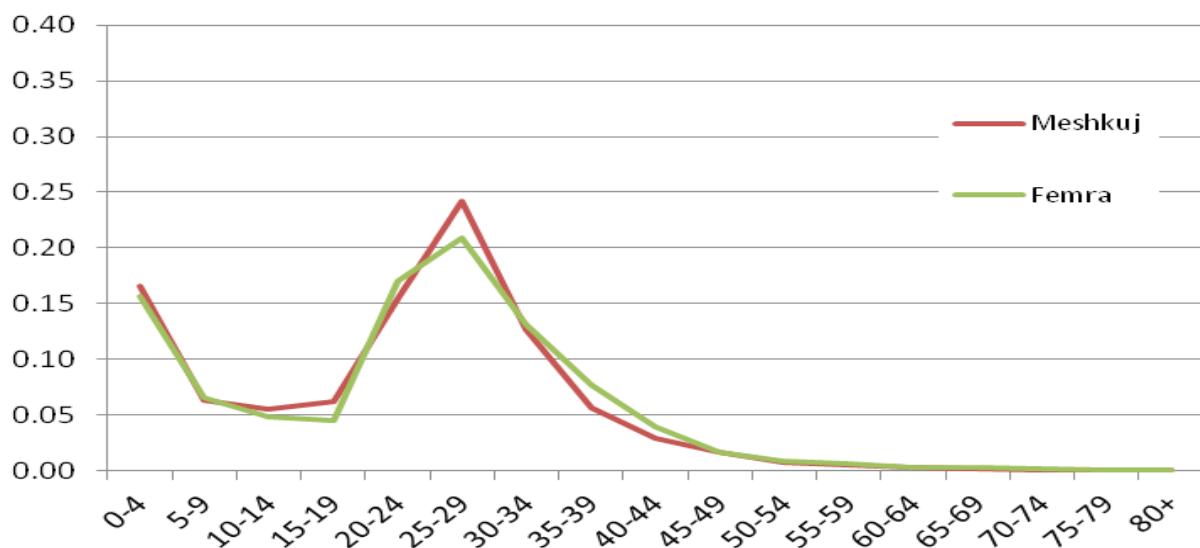

Figure 5. Emigration from Kosovo for the period 1980-2010

Source: KAS (2012d, p.16)

Figure 6 shows the breakdown of emigration rates for the years 2008-2010 for men and women, by age. Of all persons who left the country during this period, higher percentages were of the persons twenty years of age, and of little children. This profile reflects the labor emigration and family emigration/family reunion. The age profiles for men and women are very similar. On average, 48.5 percent of all the persons who have emigrated during the concerned period were women.

Figure 6. Age-specific ratios for the level of emigration 2008-2010, by gender

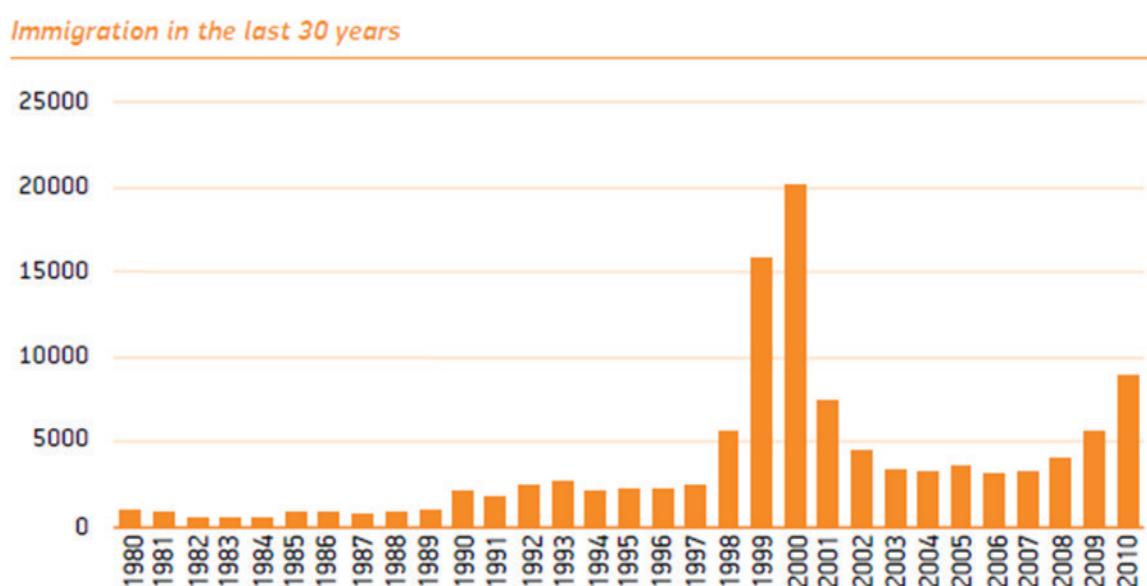

Source: KAS (2012d).

2.5 Immigration

Census information on immigration is available for each year during the period 1980-2010; (see Figure 7). The twelve-month criterion is also used here for the definition of immigration.

The high levels of immigration in 2008-2010 are a result of an agreement between Kosovo and the European Union regarding the forced return of former Kosovo residents, many of whom have stayed illegally in EU countries.

Figure 7. Immigration in Kosovo in the last 30 years

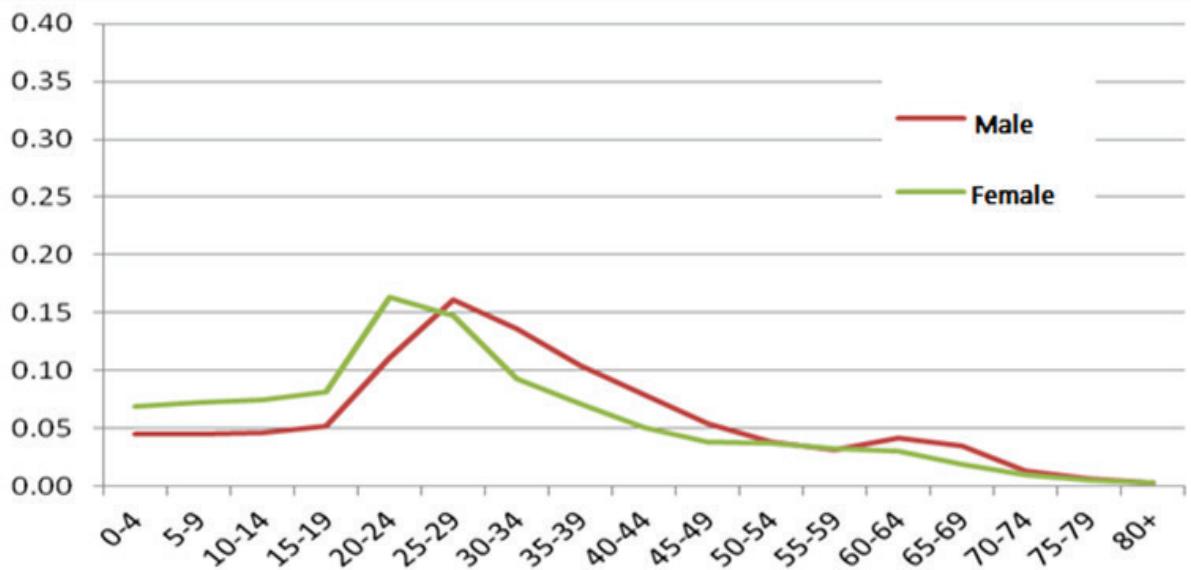

Source: KAS (2012d, p.10.).

Immigration in the four northern municipalities is not included in these figures. The overall impression is that the immigration flux from abroad to these municipalities is modest.

Figure 8 shows a division of the immigration flux rates into the five-year age group for men and women for the years 2008-2010.

Figure 8. Age-specific ratios and immigration level by gender 2008-2010

Burimi: KAS (2012d).

According to immigration, men are several years older than women. There are also little children among the immigrants. This shows that the majority of immigrants are adult immigrants returned to Kosovo, perhaps with a partner, but seldom with children. There is a relatively big number of elderly people, at least compared to the profile of emigration age in Figure 6. On average, 37.4 percent of all persons who have immigrated during the listed period were women.

2.6 Net Migration

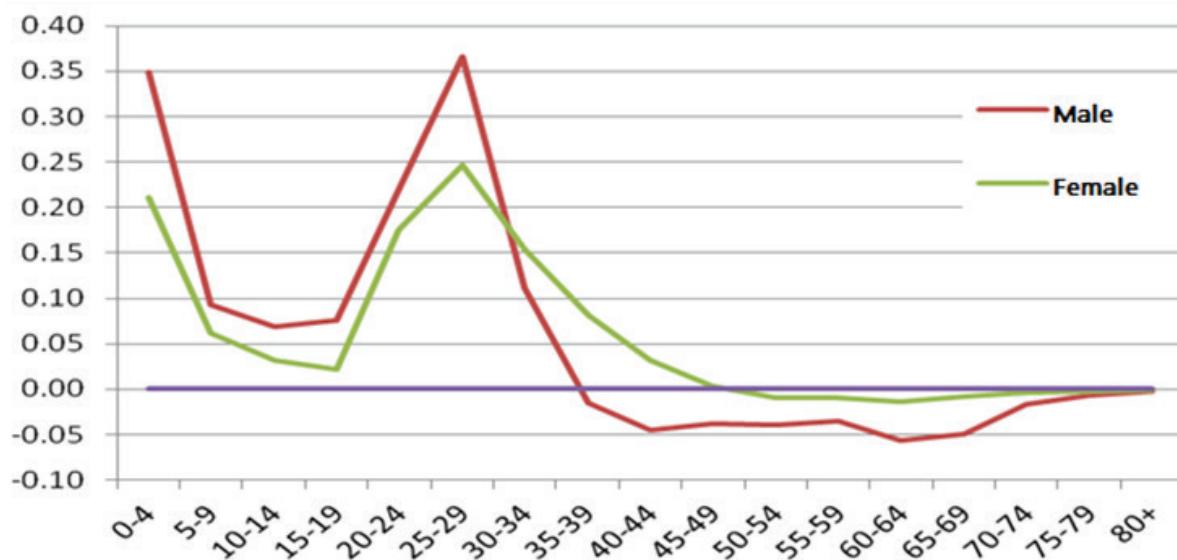

The migration balance is negative (see Figures 5 and 7). For 2011 and 2012 , KAS has estimated that the annual net migration amounts to 3,088 people. This is close to the number for 2010 (2.627), and significantly lower than in 2008 (8.117) and 2009 (8.278 inhabitants).

The downward trend in the net emigration rate during the last five years was caused by the increase of immigration and a more or less stable level of emigration (for these years).

Figure 9, presents the diagram of the age profile of men and women net emigration.

The negative percentages for the elderly emigrants reflect the fact that the immigration flux of the people belonging to these age groups is greater than the emigration flux.

Figure 9. Age-specific ratios for the level of net emigration by gender, 2008-2010

Source: KAS (2012d).

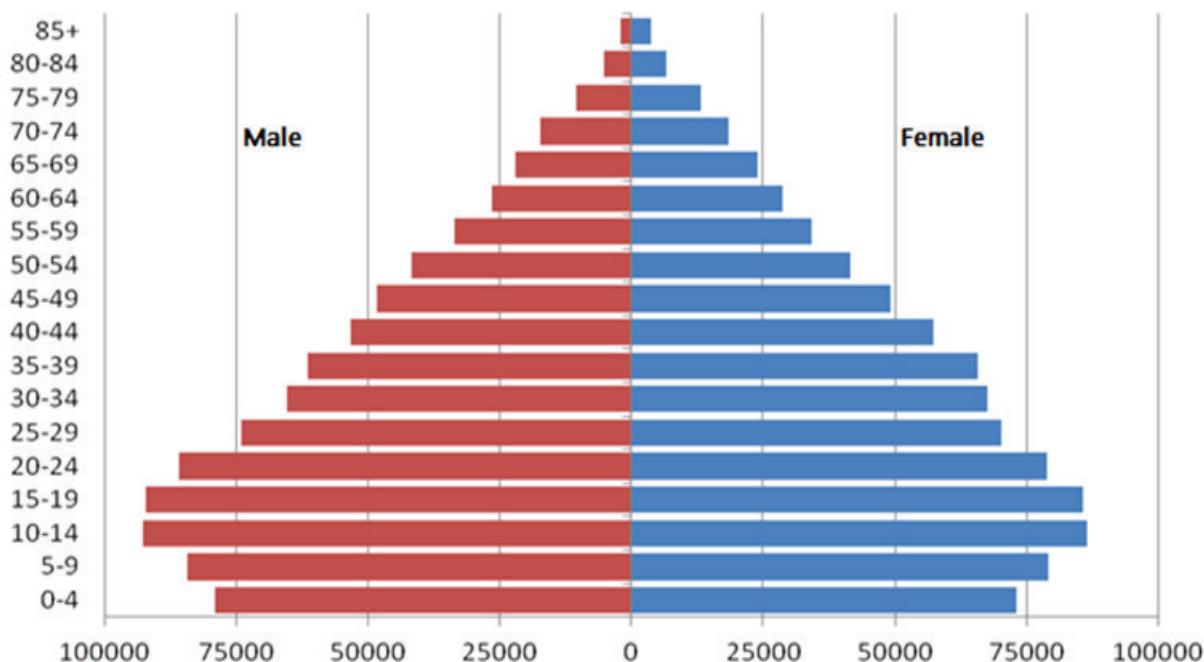

3 Base population

In this report, the base population consists of the population registered on March 31st 2011, which was 1,739,825 inhabitants.

The estimated number of 40,196 people from the northern municipalities, who were not included in the 2011 Census was added to the total population number. This means that the population size as of 31 March 2011 was estimated at 1,780,021 inhabitants.

The population of 40,196, which lives in those municipalities, is mainly Serbian, as well as a few other communities. It was assumed that the breakdown by age-gender of the persons who were not included is the same as the one of 25,532 Serbs living in other parts of Kosovo, who were part of the Census.

Figure 10 shows the pyramid of the population as of 31 March 2011 by gender and age.

Source: Population census data and population estimates by age group and gender

The population is quite young: 28 percent of the population is younger than 15. Half of the population is younger than 28.2. The average age of the population (April 2011) is equal to 30.2 (including the 40,196 inhabitants).

However, a serious decline in natality in the last decades (probably combined with the decline in the infant and children mortality) is obvious; (see Figure 2). These results are essentially the same as those of the Population Census.

4 Projections for natality, mortality and net migration in the future

In order to estimate the uncertainty in the historical trends of natality, mortality and international migration, three variants of each of the three components were formulated for the future population developments. The difference between the High and Low variant for migration is relatively significant due to lack of data mentioned above for this component.

4.1 Natality

The structure shown in Figures 1 and 2 about natality trends in the past, show a decline in TNR starting from 1985-1990, but with a much leaner declining trend in the recent years.

The average age of women giving birth after 2008 has remained relatively unchanged. The 2009 DHS evidences that many women are familiar with the modern contraceptive methods.

Because of many factors, such as: women education level, employment, family planning, delayed marriage, economic situation etc., the TNR is likely to decline further, from the average level of 2.0 children per woman that was in 2011, to 1.7 children per woman in 2031, and 1.5 children per woman in 2061 (Medium Variant).

The assumption for the year 2061 reflects a level comparable to the current natality rate in the European Union:

<http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&language=en&pcode=tsdde220&plugin=1>

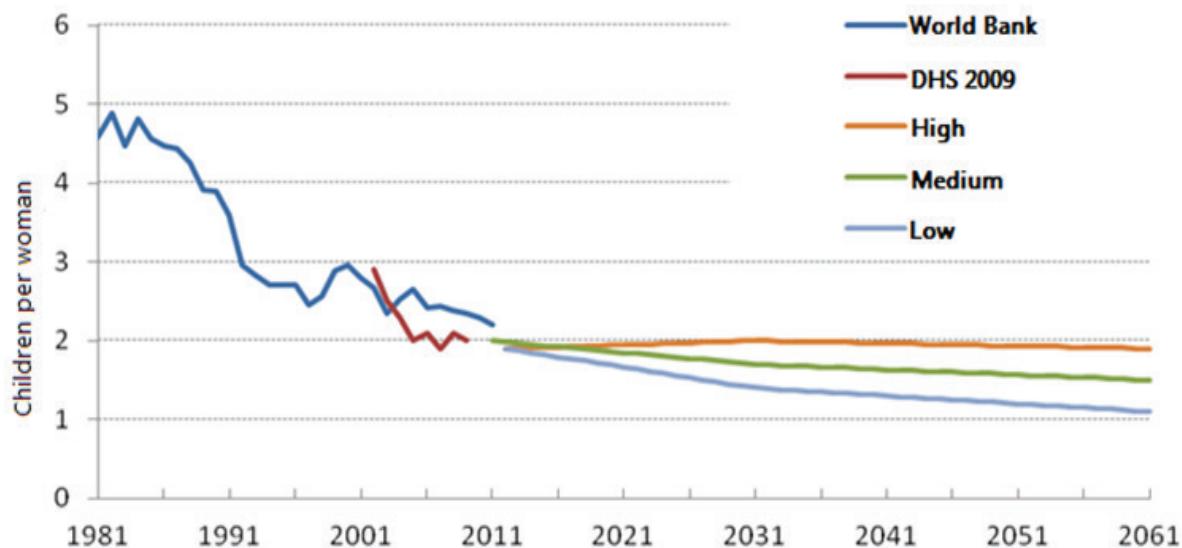

The average birth rate for the years 2008-2012, which was 28.8 years, was taken as constant age for the following years as well.

In addition to the most likely variant, we also formulated the High Variant and the Low Variant. The Low Variant forecasts a more significant decline than in the Medium Variant, with the TNR levels declining from 1.4 to 1.1 children per woman in the years 2031 and 2061.

In the High Variant, the TNR values are 2.0 and 1.9 children per woman in the years 2031 and 2061. The natality age structure is the same for the three variants.

Figure 11 shows the assumed TNR trends. Historical series from the World Bank and DHS for 2008 are included as reference.

Figura 11. Norma Totale e Lindshmërisë: vlerat historike (1981-2011) dhe të supozuara (2011-2061).

Source: See within the figure

4.2 Mortality

The 2009 ADSH shows a decline in the infant mortality rate (IMR). Starting from the high infant mortality rate during 1980-84 that was 72.4 per thousand, IMR has decreased regularly up to 9.5 per thousand during 2005-2009.

IMR used in the life expectancy table of year 2011 was 11.6 promil.

The 2011 vital statistics show a N5NV of approximately 13.3 promil . These estimations show that the decline in the infant and children mortality rate has most likely stopped in the recent years. For other group ages there is no reliable information on the mortality age structure for other years except 2011. Therefore, we will assume a constant age structure for the entire projection period.

With the exception of an interruption during the war in 1999 and the immediate years thereafter, the life expectancy of men and women has been increasing regularly (see figure 4).

Therefore, the assumption is that life expectancy at birth will continue to increase. In the Medium Variant for mortality, we assume there will be a decrease of 0.17 years per calendar year for both genders, similar to the average increase during 1981-1998.

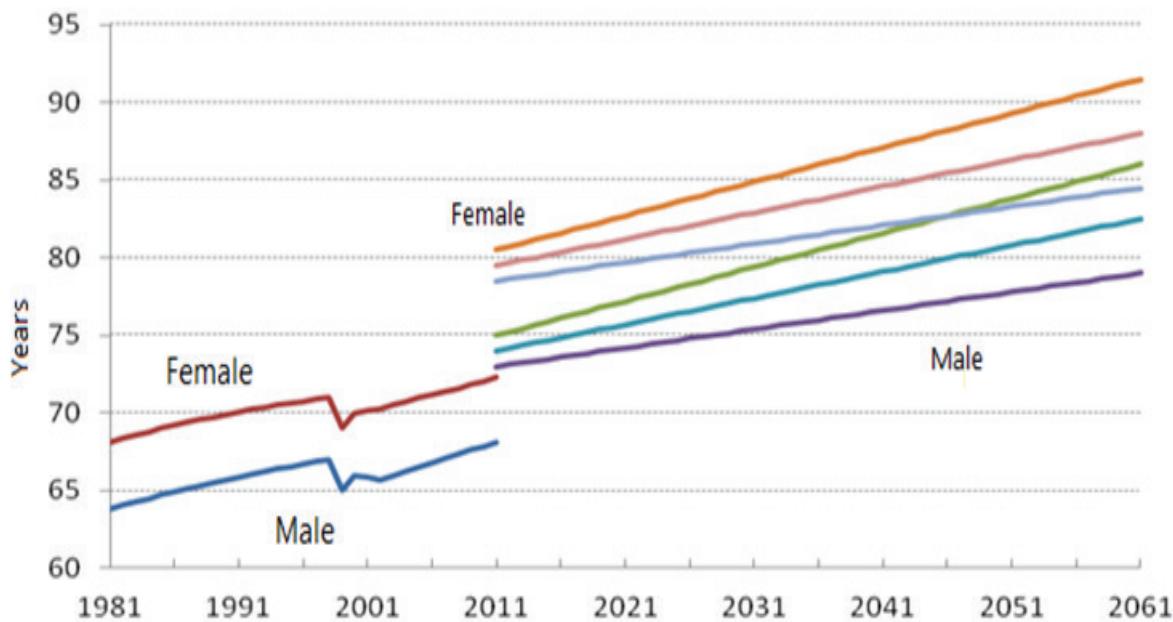

This would imply an increase of 8.5 years for a 50-year projection period. In the High Variant (High life expectancy; in other words low mortality) and the Low Variant, we assume an increase towards 2061 equal to eleven years and six years respectively.

In Section 2.3 we noticed some problems associated to the estimation of the current mortality rate. Therefore, we will start with the increasing curves for life expectancy in 2011 from the estimated levels of 73 and 75 years for men in the Low Variant and High Variant repectively. The Medium Variant starts at 74 years.

The initial levels for women in 2011 are 78.5, 79.5, and 80.5 years for the Low, Medium and High Levels respectively.

Figure 12 shows the diagrams of these assumed life expectancy levels.

Figure 12. Life expectancy at birth: Historical (1981-2010) and assumed rates (2011-2061).

Note: Historical rates are in accordance with the 60 percent under-enumeration of deaths; the assumed values with an under-enumeration rate of ten percent.

In order to specify the men and women age-specific mortality rates for the coming years, the Rowland program for each gender requires a pattern of mortality age in terms of survival ratios in the life expectancy table, along with the time intervals for two parameters: parameter α , which modifies the mortality rate, and parameter β which changes the age pattern.

Survival ratios in the life expectancy table will be taken from the life expectancy table of 2011. The constant age structure is taken with the assumption that β is equal to the length of the whole projection period. The values of α for 2011 and 2061 will be found through estimation and error margins. The program calculates and shows the life expectancy values automatically as soon as the specific time intervals for α and β are specified. It also finds the values of α for the in-between years by adding the estimated values between the two known values.

4.3 Emigrimi

Figure 5 shows that the emigration as registered in the Census varies between 10,000 and 15,000 persons per year in the last eight years. In the period 2008-2010, the annual emigration was on average around 12,600 persons.

However, these figures are a bit unreliable. For 2011, we will assume that emigration reaches 11,500, 12,500 and 13,500 persons in the Low, Medium and High variant of emigration.

For the years to come, especially for the distant future (over 50 years), the emigration levels are difficult to estimate. They are defined by the unpredictable economic, political and legal processes. An important additional factor is the actual age distribution of the population. Most emigrants are between 20 and 50 years old; (see figure 5).

Low birth rates of the groups born in the past ten years will lead to fewer immigrants sometime thirty years from now, the other things are equal. However, before these groups of low birth rate go through the emigration prone ages, the large groups born around 15 years ago will come first.

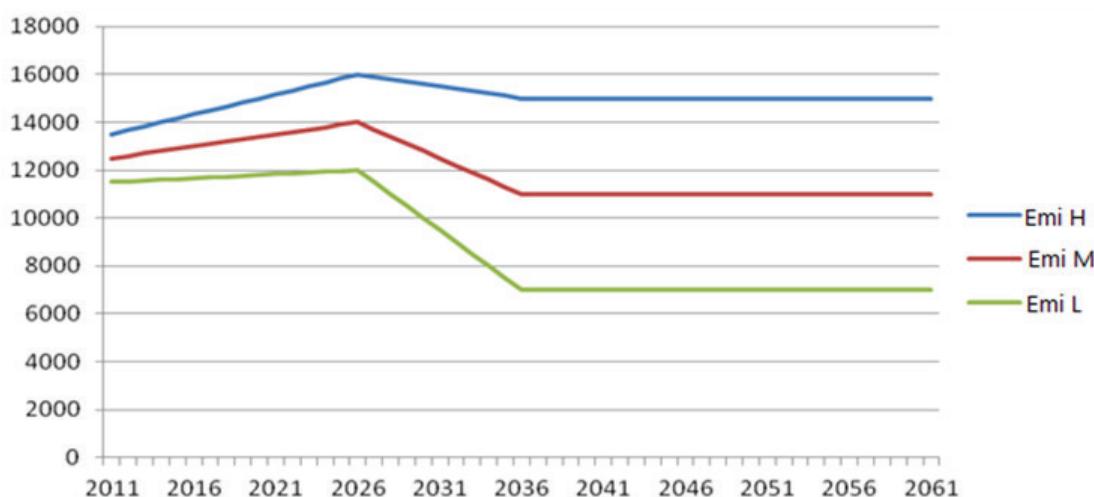

Therefore, we can initially expect an increase in the emigration rates, followed by a sharp decrease - again, based on the assumption that factors other than the demographic ones will remain constant.

In the Medium Variant, the assumption is that emigration will increase from 12,500 persons in 2011 to 14,000 persons in 2026. As a result of small groups entering the migration prone age, there will be a decrease in the future, resulting in the level of 11,000 emigrants in 2036.

Due to the considerable uncertainty on emigration in the future, we will not assume an explicit trend in the following years. Moreover, we will assume a relatively large margin between the Low Variant and the High Variant levels of emigration.

In the High Variant, the assumption is that emigration will increase from 13,500 people in 2011 to 16,000 people in 2026, and will decrease to a little less than 15,000 people in 2036. In the Low Variant, the basic assumption is the moderate increase of 12,000 people in 2026, followed by a gradual decrease to 7,000 people in 2036. Figure 13 shows the assumed trends.

Figure 13. Emigration: The assumed values for the period 2011-2061

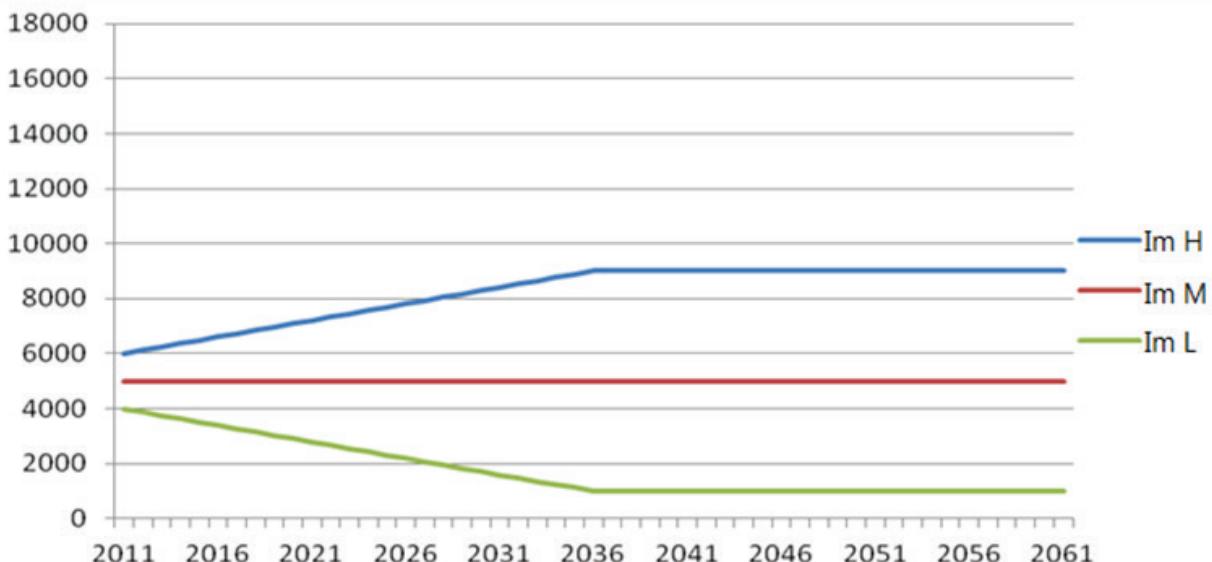

4.4 Immigration

As mentioned above, the recent increase in the immigration flux (Figure 7) was caused by the forced return of the emigrants from the past as a result of the agreements between EU and Kosovo Government. There is no reason to assume that this high level will continue in the future as well. A guess based on information is that the flux between 4,000 and 6,000 individuals would have resulted even without the agreement with EU.

We assume a constant immigration level of around 5,000 persons during the whole projection period for the Medium Variant.

In the Low Variant, it is assumed that there will be a decrease from 4,000 to around 1,000 immigrants, while in the High Variant we assume that there will be an increase from 6,000 to around 9,000 immigrants, and after 2036 it will be constant. (See Figure 14).

Figure 14. Immigration: The assumed rates for the period 2011-2061

4.5 Net migration

High emigration rates are combined with Low immigration rates, and vice versa, and the purpose is to find a group of stable variants for net migration. This results in the following assumptions for net migration in 2011, 2026, and 2036; see Table 3. The rates for intermediate years are found by entering the linear rates.

Table 4. Assumptions for the annual net immigration rates (Immigration minus emigration)

Variants	2011	2026	2036 e tutje
Low	-9,500	-13,800	-14,000
Medium	-7,500	-9,000	-6,000
High	-5,500	-4,200	+2,000

Note: The negative number shows the net emigration.

For each of the three variants of net migration, the numbers in Table 3 along with the data on the age structure as in figure 9 are inserted into the software. The age structure is the same in all three variants.

5. Combination of the Variants

In the future, the content of each of the three components of change (natality, mortality, net migration) is formulated within the High, Medium and Low Variants. In theory, one can calculate $3 \times 3 \times 3 = 27$ different variants of projection based on these different assumptions. In practice, only three projection variants will be calculated: one for the high population growth (High), one for the medium population growth (Medium) and one for the low population growth (Low). Table 6 shows the way the variants are combined for the three components.

Table 5. Combination of variants for the components of growth.

Projection variant	Natality	Life expectancy	Net migration
Low Growth	Low	Low	Low
Medium Growth	Medium	Medium	Medium
High Growth	High	High	High

Note 1. Low life expectancy corresponds to high mortality rates.**ata breakdown by large groups**
